

Workplace interventions for burnout: a systematic review and meta-analysis

Abstract

Burnout is a growing occupational health concern. This systematic review aimed to synthesize evidence on organizational interventions for reducing burnout among adult employees.

2. Methods

We searched PubMed, PsycINFO and Scopus from January 2000 to March 2020. The search combined the terms (burnout OR "emotional exhaustion") AND (intervention OR program OR trial) AND (workplace OR organizational). We included randomized controlled trials and quasi-experimental studies of adult employees. Studies without a control group were excluded, as were dissertations and conference abstracts.

3. Results

Of 3,412 records identified, 58 studies met the inclusion criteria and were included in the synthesis.
